

## minimum-energy reaction path

**Acronym:** MERP

Path orthogonal to the equipotential contours of a potential energy surface that connects the energy minima through a saddle point (transition state) from which it slopes downwards along the steepest descending lines in  $3N - 6$  configurational space ( $N$  is the number of nuclei in the reacting system).

**Note:**

MERP calculation allows the investigation of detailed changes in molecular structure describing the transformation of reactants to products.
