## reduced species

A term used to characterize the degree of reduction (or oxidation) in atoms, molecules and ions. An atom in a molecule or an ion which has a low oxidation state. An element or atom in a compound can be reduced by the reaction of an element or compound with hydrogen, while it can be oxidized by reaction with oxygen. A reduced species can be formed also through the gain of electrons (either at the negative electrode in a cell or through transfer from another atom, ion or group of atoms in a chemical reaction). For example, the carbon atom in  $CH_4$  and other hydrocarbons is in a reduced state, while the carbon in  $CO_2$  is in an oxidized state. Similarly the sulfur atom in  $H_2S$  is in a reduced state while that in sulfuric acid  $(H_2SO_4)$  is in an oxidized state.
